

## Study 23a

### Laboratory Summary

A susceptible ICR lab strain of bed bugs was used to evaluate the performance of residual insecticides in the laboratory. Mixes adults were used in the tests. Folded sections of mattress covering, containing bed bugs, were sprayed at the label rate of Steri-Fab® and mortality of bed bugs was read 24 hours later.

Steri-Fab provided 96% mortality of bed bugs with no flushing or rapid knockdown noted.
