

## Study 13a

### Laboratory Summary

A laboratory study was conducted using adult bed bugs from one strain moderately resistant to pyrethroids. The bed bugs (10 large nymphs and 10 adult males) were confined to each of 4 types of 24 hours old treated substrates: fabric, unpainted wood, painted wood, and vinyl, for 4 hours.

Bedlam<sup>®</sup> Insecticide caused equal to or less than 41% mortality regardless of the substrate.
