

## Study 30c

### Laboratory Summary

This study was an evaluation of a direct Phantom<sup>®</sup> Termiticide-Insecticide spray to eggs from Harlan (susceptible) and Jersey City (pyrethroid resistant) strains of bed bugs. Mortality of eggs and emerging nymphs was noted.

The Phantom treatment resulted in 97% and 95% of the eggs from the two strains hatching. One hundred percent of the emerged nymphs from the Harlan strain were killed while 96% of the Jersey City nymphs were killed.
